# Equivalence of PDA, CFG

Conversion of CFG to PDA

Conversion of PDA to CFG

# Overview

- When we talked about closure properties of regular languages, it was useful to be able to jump between RE and DFA representations.
- Similarly, CFG's and PDA's are both useful to deal with properties of the CFL's.

# Overview – (2)

- Also, PDA's, being "algorithmic," are often easier to use when arguing that a language is a CFL. *Context - Free language*
- **Example:** It is easy to see how a PDA can recognize balanced parentheses; not so easy as a grammar.
- But all depends on knowing that CFG's and PDA's both define the CFL's.

# Converting a CFG to a PDA

- Let  $L = L(G)$ . Grammar
- Construct PDA  $P$  such that  $N(P) = L$ . CFG PDA
- $P$  has:
  - One state  $q$ .
  - Input symbols = terminals of  $G$ .
  - Stack symbols = all symbols of  $G$ .
  - Start symbol = start symbol of  $G$ .

PDA

CFG

# Intuition About P

- Given input <sup>String</sup>  $w$ , P will step through a leftmost derivation of  $w$  from the start symbol  $S$ .
- Since P can't know what this derivation is, or even what the end of  $w$  is, it uses nondeterminism to “guess” the production to use at each step.

## Intuition – (2)

Derivate  
start  
symbol

- At each step,  $P$  represents some *left-sentential form* (step of a leftmost derivation).
- If the stack of  $P$  is  $\alpha$ , and  $P$  has so far consumed  $x$  from its input, then  $P$  represents left-sentential form  $x\alpha$ .
- At empty stack, the input consumed is a string in  $L(G)$ .

# Transition Function of P

1.  $\delta(q, a, a) = (q, \epsilon)$ . (*Type 1* rules)
  - This step does not change the LSF represented, but “moves” responsibility for  $a$  from the stack to the consumed input.
2. If  $A \rightarrow \alpha$  is a production of  $G$ , then  $\delta(q, \epsilon, A)$  contains  $(q, \alpha)$ . (*Type 2* rules)
  - Guess a production for  $A$ , and represent the next LSF in the derivation.

# Proof That $L(P) = L(G)$

- We need to show that  $(q, wx, S) \vdash^* (q, x, \alpha)$  for any  $x$  if and only if  $S \Rightarrow_{lm}^* W\alpha$ .
- **Part 1:** “only if” is an induction on the number of steps made by  $P$ .
- **Basis:** 0 steps.
  - Then  $\alpha = S$ ,  $w = \epsilon$ , and  $S \Rightarrow_{lm}^* S$  is surely true.

# From a PDA to a CFG

- Now, assume  $L = N(P)$ .
- We'll construct a CFG  $G$  such that  $L = L(G)$ .
- **Intuition:**  $G$  will have variables generating exactly the inputs that cause  $P$  to have the net effect of popping a stack symbol  $X$  while going from state  $p$  to state  $q$ .
  - $P$  never gets below this  $X$  while doing so.

# Variables of G

- G's variables are of the form  $[pXq]$ .
- This variable generates all and only the strings  $w$  such that
$$(p, w, X) \vdash^*(q, \epsilon, \epsilon).$$
- Also a start symbol  $S$  we'll talk about later.

# Productions of G

- Each production for  $[pXq]$  comes from a move of  $P$  in state  $p$  with stack symbol  $X$ .
- **Simplest case:**  $\delta(p, a, X)$  contains  $(q, \epsilon)$ .
- Then the production is  $[pXq] \rightarrow a$ .
  - Note  $a$  can be an input symbol or  $\epsilon$ .
- Here,  $[pXq]$  generates  $a$ , because reading  $a$  is one way to pop  $X$  and go from  $p$  to  $q$ .

# Productions of $G$ – (2)

- **Next simplest case:**  $\delta(p, a, X)$  contains  $(r, Y)$  for some state  $r$  and symbol  $Y$ .
- $G$  has production  $[pXq] \rightarrow a[rYq]$ .
  - We can erase  $X$  and go from  $p$  to  $q$  by reading  $a$  (entering state  $r$  and replacing the  $X$  by  $Y$ ) and then reading some  $w$  that gets  $P$  from  $r$  to  $q$  while erasing the  $Y$ .
- **Note:**  $[pXq] \Rightarrow^* aw$  whenever  $[rYq] \Rightarrow^* w$ .

# Productions of $G$ – (3)

- **Third simplest case:**  $\delta(p, a, X)$  contains  $(r, YZ)$  for some state  $r$  and symbols  $Y$  and  $Z$ .
- Now,  $P$  has replaced  $X$  by  $YZ$ .
- To have the net effect of erasing  $X$ ,  $P$  must erase  $Y$ , going from state  $r$  to some state  $s$ , and then erase  $Z$ , going from  $s$  to  $q$ .

# Picture of Action of P

# Third-Simplest Case – Concluded

- Since we do not know state  $s$ , we must generate a family of productions:

$$[pXq] \rightarrow a[rYs][sZq]$$

for all states  $s$ .

- $[pXq] \Rightarrow^* awx$  whenever  $[rYs] \Rightarrow^* w$  and  $[sZq] \Rightarrow^* x$ .

# Productions of G: General Case

□ Suppose  $\delta(p, a, X)$  contains  $(r, Y_1, \dots, Y_k)$  for some state  $r$  and  $k \geq 3$ .

□ Generate family of productions

$[pXq] \rightarrow$

$a[rY_1s_1][s_1Y_2s_2]\dots[s_{k-2}Y_{k-1}s_{k-1}][s_{k-1}Y_kq]$
